

Service Register digitisation
STANDARD OPERATING PROCEDURE

e-SR Desk Operating Procedure

How a case worker captures an existing Service Register page, records a fresh event, files the order copy against the right column, fixes pay, and moves the entry through AO, SAO and GM (Finance) — with the checks that keep the digitised record defensible against the physical register.

DOCUMENT SOP / e-SR Desk / 01	VERSION 1.1 – practice build	APPLIES TO Service Register entry, review and approval
APPLICATION e-SR Desk (hosted & standalone)	ISSUED BY to be filled by the issuing office	REVIEW DUE on first official approval of the build

SECTION 1

Purpose and scope

This procedure governs how paper Service Registers are converted into records inside e-SR Desk, and how new service events are entered there from the day the application is put to use at the desk.

It covers four kinds of work that a case worker actually does:

Back-capture

Existing SR volumes, page by page, from the first page to the last written page.

Current entries

A new event — transfer, increment, leave, encashment — recorded as it is sanctioned.

Supporting orders

The proceedings or order copy behind an entry, filed against that entry and no other.

Issue of copies

A PDF of one page, one column, the order copies in a column, or the whole register.

It does not cover pay disbursement, pension processing, or any transaction carried out in SAP or e-Office. Those remain outside this application.

SECTION 2

Standing of the record — what this application is not

Every operator must understand this before touching a page. Nothing below is a formality.

READ THIS FIRST

The physical Service Register remains the record of authority. e-SR Desk holds a migration draft. Where the two differ, the paper register governs, and the entry here is corrected to match it — never the other way round.

This is a **practice build**, labelled "Demo practice" on every screen and on every document it issues. It is not the department's official e-SR application, and it does not submit anything to it.

The approval chain records a name, a designation, a time and a practice code. Those are **typed into the application and are not verified by any department login**. The codes are not legally valid digital signatures.

A second point that matters just as much in daily work: an empty column in this application is not proof that nothing happened. It means only that nothing has been captured here yet. Gaps are checked against the physical register, not assumed.

SECTION 3

Definitions

TERM	MEANING IN THIS PROCEDURE
Page	One captured or typed Service Register page, identified by employee ID, SR volume and SR page number. A page carries one or more events.
Event	One service happening recorded under one entry type — a transfer, a probation declaration, an EL encashment. An event has its own fields and its own order copies.
Column	One e-SR entry type, the equivalent of a column or tab in the register. The application ships 25 module templates across 18 working tabs.
Module template	The field list behind a column. Templates are editable on Service modules and are saved per user.
Order copy	The proceedings, order or certificate behind an event, attached to that event. A multi-page PDF is split into sheets on upload.
Stage	Where an entry stands: Draft, Needs rescan, Waiting for AO, Waiting for SAO, Waiting for GM (Finance), Approved.
Practice code	A checksum written into the approval trail when a designated officer signs. It marks the record as unaltered since that signature; it is not a digital signature.
Mean confidence	The reader's own average score for the words it recognised. It is a hint about where to look. A high score does not prove a value is correct.

SECTION 4

Roles and responsibilities

ROLE	DOES	MUST NOT
Case worker data entry operator	Captures pages, corrects the read text, fills and checks every field against the page, attaches order copies, completes operator review.	Approve an entry, or enter a value that is not written in the register or in the order.
SR custodian	Produces the volumes, confirms the volume and page numbering, checks the digitised page against the paper page, signs the custodian box on the issued PDF.	Let a volume leave the custody point for scanning without a record.
AO — Accounts Officer	First approval. Checks the entry against the order quoted in it.	Approve at a stage that is not theirs. The application refuses it, and the refusal is not to be worked around by changing the designation on the sign-in.
SAO — Senior Accounts Officer	Second approval. Checks the service history around the entry for consistency.	
GM (Finance)	Final approval. Completes the chain; the page is then converted to PDF and kept with the record.	

DESIGNATION GATE

Approval is opened by the designation set on the sign-in chip in the top bar — **AO (Accounts Officer)**, **SAO (Senior Accounts Officer)** or **GM (Finance)**. Any other designation sees the stage but cannot sign it. Each officer signs in on their own device or session; the sign-in is not shared.

SECTION 5

One-time setup, before the first page

01 Choose the edition.

The **hosted application** keeps records in a private workspace tied to the account and is the one to use where AI assist is wanted. The **standalone file** runs from a single HTML file on one computer and keeps records in that browser's storage — it works without a network once the reader has loaded, but it does not synchronise with anything.

02 Check the storage line.

At the foot of the menu, the dot must read green with a description of where records are kept. If it reads **"kept only until you close the page"**, storage is blocked in that view: do not start a batch. Move to a normal browser window, or export JSON after every few pages.

03 Sign in.

Use the chip at the right of the top bar. Enter your name, employee ID and designation exactly as they appear in office records — these are written into the approval trail and printed on every issued PDF.

04 Enter the sanctioned pay scales. ONCE PER OFFICE

On **Service modules** → **Pay scales**, paste the stage figures of the scales in force, one scale to a line:

RPS 2022 JA : 30000, 30900, 31840, 32790, ...

Take the figures from the sanctioned pay-revision order. The application does not carry a built-in scale table and will not invent stages — until the library is filled, every fixation is typed by hand.

05 Check the column templates.

Open **Service modules**. Each template is marked with where its field list came from — the video manual, the SOP screenshot, or provisional. Compare the provisional ones against the register in front of you and edit the field list before bulk capture begins, not during it.

06 Decide the PDF rule.

On **Processing & AI** → **PDF output**, leave **Convert a page to PDF automatically when GM (Finance) approves it** switched on unless the office has decided otherwise.

PROCEDURE 6.1

Digitising an existing Service Register volume

Use this for back-capture, where a whole volume is being converted. One batch carries one employee.

01 Prepare the volume.

SR CUSTODIAN

Note the employee ID, the name as written in the register, the volume number, and the first and last written page numbers. Flag torn, faded or overwritten pages before scanning.

02 Open Batch capture and fill the header.

Employee ID, employee name, SR volume and the **starting SR page**. Choose **Handwritten** or **Printed / typed**. For a handwritten volume the pages are stored as images only — nothing is machine-read, so a whole book goes in within a minute. For printed pages set the language — English, Telugu, or mixed. Mixed reading is slower; use it only where both scripts appear on the page.

03 Add the pages in order.

Choose files, use the camera, or drop the files in. Pages are numbered in the order the files are listed, counting up from the starting page, and one PDF page becomes one SR page. Check the file order before reading — a page out of order becomes a wrong page reference in every record on it.

04 Read the pages.

Press **Read pages**. The reader loads on first use and each page is read, corrected for common recognition mistakes, and split into suggested events. **Cancel after current page** stops the run cleanly.

05 Work each page in the workspace.

Open the first page. The scan sits on the left, the records on the right. For every page:

- Confirm employee ID, name, volume and page number against the scan.
- Open each suggested event. Check every filled field against the page; a field marked **from text** is a suggestion, not a value.
- Add events the reader missed, and remove events it invented.
- Fill designation, post and office as they stood at the time of that entry. **Same as last entry** carries them forward.
- Where a word is unclear, use the low-confidence highlighting and the zoom before typing a guess.

06 Route what cannot be read.

If a page is too faded, torn or overwritten to enter honestly, use **More...** → **Mark for rescan** and write what is wrong with it. Do not guess. A rescan note is cheaper than a wrong service record.

07 Complete the operator review.

Follow [Procedure 6.6](#) and move to the next page.

HANDWRITING

The reader is trained on printed text. Handwritten entries are not machine-read: running handwriting, faded ink and entries written over rubber stamps produce wrong text, and wrong text in a service record is worse than none. Handwritten pages are typed by the case worker from the scan, using the standard wording in [Procedure 6.1A](#).

PROCEDURE 6.1A

Typing a handwritten register with standard wording

Most Service Registers are written by hand. The entries in them repeat the same few sentences year after year, so the case worker picks the sentence and types only the values that change.

01 Open the whole book once.

Open **New entry**, set the employee, and keep **Handwritten** selected above the page. **Upload scan / PDF** and choose the scanned volume. Every sheet in the file opens; the first is shown straight away and the next one is made ready in the background.

02 Go to the sheet you are entering.

Turn sheets with < >, the **Page Up** / **Page Down** keys, or type the sheet number. Where a sheet is a photograph of an open book, **Left page** shows columns 1–9 and **Right page** shows columns 10–15. If a column is cut at the fold, ← and → move the split.

03 Enlarge the writing.

Press +, double-click the page, or hold **Ctrl** and scroll. Drag to move around the page. **100%** fits it back.

04 Pick the standard wording.

Under **Standard wording**, choose the sentence written on the page — for example **Increment sanctioned**, **Services verified**, **Surrender leave sanctioned**, **Relieved of duties** or **Joined duties after leave**. The entry type is set for you. **Find wording...** narrows the list.

05 Fill only the blanks.

Type each value exactly as written. **Enter** moves to the next blank. Every blank fills its own field below as you type, and the finished sentence is kept in Remarks. For an increment the rise is worked out from the two basics — it is never typed. Where the page says something the wording does not, type the fields directly instead.

06 Fill designation, post and office, then save.

As they stood at the time of the entry. **Same as last entry** carries them. Then **Save & add another**: the same sheet stays open, the same wording stays picked, and the blanks are empty for the next entry. Several entries on one sheet keep one stored image.

07 Move on.

Change the SR page number when you turn to the next written page, and continue. An entry that cannot be read honestly is not guessed — leave it for the custodian with a remark.

WHY THIS IS FASTER THAN READING THE PAGE BY MACHINE

A typed increment entry is some forty words. With the wording picked, the case worker types six values. The time goes on reading the handwriting — which only a person can do reliably — and not on typing sentences that never change.

PROCEDURE 6.2

Recording a single event — entry type first

Use this for day-to-day work: one order has come, one entry has to be made. The entry type is chosen first, and the page is then read against it.

01 Set the employee.

Type the employee ID in the search box at the top of the screen, or press  to jump to it. Their name and record open, and the **Working on** bar under the application name now carries the employee ID and name on every screen. That bar is the check against entering an event in the wrong register.

02 Open New entry and choose the entry type.

Press **Add entry** on the bar. Pick the entry type — for example **EL Encashment** — before doing anything else. Fill the SR volume and page number when the entry has been written into the physical register; leave them empty if it has not yet.

03 Put the page in front of the application.

Take photo, Upload scan / PDF, or drop the file. For a **printed or typed** page, choose **Printed / typed** and keep **Enhance before reading** on for faint or grey paper — the page is read as soon as it lands, and the fields of the chosen entry type fill from it. For a **handwritten** page, follow Procedure 6.1A.

04 Check each field against the page.

Fields filled from the text carry a **from text** mark until you touch them. Read each one against the scan. Dates accept 02112013 and turn it into 02.11.2013 ;  enters today's date.

05 Correct the text where the reading is poor.

Open **Text from the page**. **Auto-correct** fixes common recognition mistakes in English labels, numbers and dates. In the hosted application, **Correct with AI** does the same on harder pages; it asks before sending the page text. Then **Fill fields from text**.

06 Attach the order copy.

Follow Procedure 6.4. Do this before saving, so the order travels with the entry from the start.

07 Fill designation, post and office.

These are as they stood **at the time of this entry**, not today. **Same as last entry** carries forward the last recorded set for this employee; change it if the entry falls after a promotion or transfer.

08 Save.

Save entry files it and opens the employee record. **Save & add another** keeps the employee, volume and entry type for the next one — use it when a single order covers several entries.

PROCEDURE 6.3

Recording an entry with no page to scan

A fresh event often has no register page yet — the order has come, the entry is being made for the first time.

01 Start the entry the same way.

Use **Entry without a scan** from Today, or **Add entry** on the Working-on bar.

02 Leave the page image empty and type the fields.

The entry saves with no image. It is marked as a typed entry, and that marking is carried into every PDF it appears in.

03 Attach the order copy.

With no scan of the register page, the order copy is the only supporting document on the entry. Attaching it is not optional here.

04 Fill the SR volume and page when the register is written.

Until then the entry is marked as a fresh entry rather than an SR page. Open it from the employee record later and add the reference; saving again after the entry has been approved clears the approvals, which is correct — the record changed.

PROCEDURE 6.4

Filing an order or proceedings copy against a column

An order belongs to the entry it was issued for. Filing it anywhere else makes it impossible to issue that column on its own later.

01 Open the right entry.

On **New entry**, open **Order copy for this entry**. On a saved page, open the event card in the workspace and use **Order copies for this entry only**. Check the column name shown there before attaching.

02 Upload or photograph the order.

PDFs and images are both accepted, and several files can be added at once. A multi-page PDF is taken apart **sheet by sheet** as it arrives, so each sheet can be re-issued on its own. Up to 60 sheets are taken from one file.

03 Confirm what was filed.

Each file appears with a thumbnail, its sheet count and the time it was added. **View** opens every sheet. **Remove** takes the file off the entry.

04 Save the page.

On a saved page the attachment is written to the record immediately. On a new entry it is written when the entry is saved.

WHY IT IS KEPT PER COLUMN

Because the issued copy follows the same rule. In the employee record, **Columns, orders & PDFs** issues a **Column PDF** for one column, or **Orders only** — the order copies filed in that column, with an index, and nothing from any other column. An order filed against the wrong entry turns up in the wrong file.

PROCEDURE 6.5

Pay fixation — increment, promotion, pay revision

Fixation is worked out from the pay-scale library entered at setup. Where the library cannot answer, the application says so rather than assuming a figure.

01 Start a Pay Fixation entry.

Choose **Pay Fixation** as the entry type. A calculator opens above the fields.

02 Pick the occasion.

OCCASION	WHAT THE APPLICATION DOES	WHAT YOU MUST SUPPLY
Annual increment	Moves the present basic to the next stage of the same scale and works out the next increment date.	Present basic, scale, effective date.
Promotion	Grants one increment in the present scale, then fixes at the next stage of the promoted scale — both steps shown.	Present basic, present scale, promoted scale, effective date.
Pay revision	Applies the fitment percentage, then fixes at the next stage of the revised scale.	Present basic, revised scale, fitment percentage from the order .

03 Read the working before accepting it.

The calculator prints each step — before fixation, the increment, the stage fixed at, and the rise. Check it against the fixation statement. Press **Calculate** to fill the entry fields, then correct anything that differs.

04 Attach the fixation order and save.

The order reference, order date and the authority are part of the entry. The employee record then shows the basic after the last fixation, the occasion, the scale on record and the next increment due.

WHAT THE APPLICATION WILL NOT DO

It will not supply a fitment percentage. That comes from the pay-revision order, and the calculator refuses to proceed without it. It will not add stages to a scale that was never entered, and it does not apply any rule about stagnation increments, pay protection or option dates — those are worked out by the office and typed in.

PROCEDURE 6.6

Operator review

Operator review is the case worker's statement that the digitised page matches the paper page. It is not an approval.

01 Work through the issue list.

Required fields that are empty, dates that do not parse, and date pairs in the wrong order are listed under the page header. Clicking an issue jumps to the field.

02 Compare the page one last time.

Employee ID and name, volume and page number, each event's type, each date, each order number.

03 Press Complete operator review. CTRL + ENTER

The page moves to **Waiting for AO** and appears in the review queue for the officers.

TAMPER EVIDENCE

Editing a page after it has been approved clears the approvals and returns it to draft. This is deliberate. An approval stands for the record as it was signed, and a changed record needs a fresh signature.

PROCEDURE 6.7

Approval chain — AO, SAO, GM (Finance)

01 Open the page from the review queue.

Filter by stage to see only what is waiting at your level.

02 Check, then sign.

Open the **Approvals** panel. It shows the chain, who has signed, when, and with what practice code. **Approve & sign** is enabled only for the officer whose stage it is. A remark can be added and is kept in the trail.

03 Or return it for correction.

Return for correction requires a written reason. The page goes back to the case worker as a draft, the chain is cleared, and the reason is shown at the top of the page until it is fixed.

04 Final approval.

When GM (Finance) signs, the chain is complete. If automatic conversion is on, the page is turned into a PDF at that moment and kept with the record — the employee record and the digital register then show a **PDF** mark against it.

The chain is: **Operator review** → **AO** → **SAO** → **GM (Finance)**. A stage cannot be skipped, and an officer cannot sign two stages.

PROCEDURE 6.8

PDF output and filing

Documents are built inside the browser. Nothing is uploaded to produce them, and they work with no network.

DOCUMENT	CONTAINS	ISSUED FROM
Page PDF	The typed record, the approval trail, the text read from the page, the scanned page, and every order copy on that page.	Workspace More... , or the PDF button on any row in the employee record or the digital register.
Column PDF	Every entry in one column for one employee, oldest first, with that column's order sheets.	Employee record → Columns, orders & PDFs .
Orders only	An index of the order files in one column, then each sheet on its own page.	The same panel, on columns that have orders.
Register PDF	Cover, column index, every column in e-SR tab order, then all source scans and all order sheets.	Register PDF on the Working-on bar or the employee record.
Register without images	The same, text only — small enough to send by e-mail.	The same panel.

Rules for issue

01 Issue only approved pages outside the desk.

A draft PDF is for internal checking. Anything leaving the section should have the chain complete.

02 Do not remove the notice.

Every page of every document carries **"Migration draft — not an authenticated digital Service Register"** and the **Demo practice** mark. They stay until the build is officially approved.

03 Get the custodian box signed.

Each page PDF ends with a blank box for the SR custodian's manual check. An issued copy without it is not a checked copy.

04 Bulk conversion.

Processing & AI → Make a PDF for every saved page runs through all saved pages one after another. Run it at the end of a batch, not during one.

TELUGU IN ISSUED DOCUMENTS

Telugu lines are drawn as pictures so the script prints exactly as it appears on screen. Those lines cannot be selected or searched in the PDF; the English text can.

PROCEDURE 6.9

Backups, exports and handover

01 Export JSON at the end of every working day.

Processing & AI → Export JSON, or Export JSON on one employee's record. Keep the file on the office drive with the date in the name. **Source images and order sheets are not part of a JSON export** — it restores the records, not the pictures.

02 Export CSV when figures are wanted in a spreadsheet.

One row per field per event, with where each value came from — operator, text, AI or carried forward.

03 Keep the issued PDFs.

They are the only export that carries the scans and the order copies. For a volume that has been fully captured, the register PDF is the archive copy.

04 On handover of the standalone file.

Records live in that computer's browser storage, not in the HTML file. Copying the file to another machine copies the application, not the work. Export JSON, copy the PDFs, and import the JSON on the new machine.

SECTION 7

Quality rules — check before every review

☐ **Every value is on the page or in the order.** Nothing is entered from memory, from another employee's file, or from what seems likely.

☐ **Employee ID and name match the register**, spelling included, and match the Working-on bar at the top of the screen.

☐ **Volume and page number are the ones written on the page**, not the position of the file in the batch.

☐ **Every date reads DD.MM.YYYY** and falls in a sensible order — relief before joining, from before to, order date not after the effective date without a reason.

☐ **Designation, post and office are as at the date of the entry**, not as of today.

☐ **Every field marked "from text" has been read against the scan** and either accepted or corrected.

☐ **The order copy is attached to the entry it belongs to**, and its sheet count matches the paper order.

☐ **A pay fixation has been checked against the fixation statement**, figure by figure.

☐ **Unreadable pages are marked for rescan** with a note, not filled in with a best guess.

☐ **Nothing fictional is left behind.** The sample page shipped with the application is fictional and is deleted once practice is over.

SECTION 8

Shortcuts and time-savers

KEY	DOES
/	Jump to the employee search in the top bar.
Ctrl + S	Save the open page as a draft.
Ctrl + Enter	Complete the operator review on the open page.
Alt + N	Add an event to the open page.
02112013	In any date box, becomes 02.11.2013.
t	In any date box, becomes today's date.

Working faster without working looser

Save & add another

Keeps the employee, volume and entry type. Use it when one order produces several entries.

Same as last entry

Carries designation, post and office forward. Check it against the date of the entry before accepting.

Duplicate an event

Copies an event with its values so only what differs is typed. Change every field that differs, including the dates.

Collapse what you are not using

Every panel folds. The application remembers what you left closed, so the screen stays on the work in hand.

SECTION 9

Troubleshooting

WHAT YOU SEE	WHAT IT MEANS	WHAT TO DO
"Work here is kept only until you close the page"	Browser storage is blocked in this view.	Open the application in a normal browser window. Do not start a batch until the storage line reads green.
The reader will not load	The reading engine and its language data come from the internet on first use.	Connect once and read one page; afterwards it works from the browser's cache. Until then, type the entry and attach the picture.
Very low mean confidence	Faint, skewed or handwritten paper.	Re-scan straighter and brighter, turn on Enhance before reading , or type the entry from the scan.
No fields filled after reading	The page holds other entry types, or the labels do not match the template.	Use Fill fields from text after correcting the text, or type the fields. Then fix the column's template on Service modules .
"Fitment percentage is needed"	A pay-revision fixation was attempted without the percentage.	Take it from the pay-revision order and enter it. Do not estimate it.
The scale is not in the list	It has not been entered in the pay-scale library.	Add it on Service modules → Pay scales from the sanctioned order, then calculate again.
"Only GM (Finance) can approve at this stage"	The chain is working as intended.	Send it to the officer whose stage it is. Do not change the designation on the sign-in to get past it.
"This page was saved in another tab or device"	The same page was opened twice.	Load the latest version and re-apply your correction. Two people should not hold the same page open.
The PDF is very large	It carries scans and order sheets.	Use Register without images for e-mail, and keep the full copy on the office drive.

SECTION 10

Limitations and what still needs the department

These are stated plainly so that no one plans around a capability that does not exist.

ITEM	POSITION TODAY
Official e-SR submission	Not available. Records leave this application as JSON, CSV or PDF. Loading them into the department's application is a separate, approved step that does not yet exist.
SAP and e-Office	No connection. Attendance, payslips and bills are not touched by this application.
RPS 2022 scale stages	Not built in. They are entered once from the sanctioned order; the application will not invent a stage.
Fixation rules	Increment and promotion follow the stage table. Fitment percentage, pay protection, stagnation increments and option dates come from the order and the office.
Identity of approvers	Typed, not authenticated. There is no department login behind the approval chain.
Handwriting	Not read reliably. Expect manual entry.
Field lists	Some column templates are provisional, drawn from the video manual and the SOP screenshot. Each is marked with its source and is to be confirmed against the register.
AI assist	Hosted application only, and only for correcting text that was already read. It never adds a value that is not in the text, and it asks before the text is sent.

REVIEW OF THIS PROCEDURE

This document describes a practice build. When the build is put up for official approval, this procedure is reviewed in full — particularly Sections 2, 4 and 10 — and re-issued before any register is treated as migrated.
